Item reporting

+

...

✓ **Description**

This epic covers how listings get into the system in the first place. It lets an Owner submit a Lost Item Report with a photo, description, category, location, and date, and lets a Finder submit a Found Item Post with the same set of details. It also covers the system automatically extracting visual and text tags from any uploaded photo, and letting a Finder set one or more private proof-of-ownership questions when they post a found item. Nothing else in the system can function until this epic exists, since matching, verification, and moderation all depend on listings actually being in the database.

Matching Engine & Notifications

✓ Description

This epic is the core auto-matching logic that ties Lost and Found posts together. It covers matching a newly posted Found item against active Lost reports using category, color tags, and location radius, and automatically dispatching a notification to the potential owner when a match is found. It also covers the performance requirement that matching stay fast even as listings scale up (under 3 seconds across 10,000 active listings), and the case where the system flags a low-confidence or mismatched pairing for admin review instead of surfacing it directly to a claimant.

Ownership Verification & Claiming

✓ Description

This epic covers what happens once a potential match has been found and someone tries to claim an item. It includes the claimant answering the finder's private security question(s) before anything else happens, the system checking those answers and only revealing the finder's contact details on a successful match, and handling the failure path where wrong answers get a retry and, after three failed attempts, the claim gets locked and flagged. It ends with both the Lost report and Found post being marked resolved once a claim succeeds — this is the flow you already have a full use-case spec written for.

☒ LFC-14	reveal contact details on verification	⬆ High	1	 Unassigned	To Do ▾

Admin & Moderation

▼ **Description**

This epic is the Community Admin's cleanup toolkit. It covers reviewing listings that get reported as suspicious, duplicate, or fraudulent, removing or deactivating a bad listing quickly once flagged, and separately reviewing matches the system itself flagged as questionable rather than user-reported. It's smaller in scope than the other three epics but is what keeps the platform trustworthy as more listings and matches pile up.
